

Problem Solving and Programming in Python Day-4

Date - 14 June 2019

Day Objectives

- Python Data Structures
 - Lists
 - Tuples
 - Dictionaries
- Dictionaries
- Advanced Problem Set
- Packages and Modules in Python

Python Data Structures

Lists

```
In [49]: 1 li = [123, 978, 654]
2
3 li # Access the entire List
4
5 li[1] # Access an element with index in a List
6
7 li[1:] # Access all elements second element to last element
8
9 li[::-1] # copying the elements and give us in reverse order but still we ha
10
11 li # same List is there by above reverse order
12
13 li = li[::-1] # donot copying putting entire List as in reverse order
14
15 li # List has changed as reverse order
16
17 li = li[::-1]
18
19 li[::2] # Accessing even index elements as a List
20
21 li[1::2] # Accessing odd index elements as a List
22
23 li[1] # Accessing the index value not as List but as value i.e we donot get
24
25 # Lists can be accessed , manipulated in two Different ways
26     # Direct referencing - [index] # Accessing using "[]" square brackets
27     # Indirect Referencing - through functions
28
29 li.append(345) # Adding an element to end of the List
30
31 li
32
33 li.insert(1,234) # Adding an element at a particular position(index)
34
35 li
36
37 li.sort() # Sort elements in ascending order
38
39 li
40
41 li.pop() # Remove the Last element in a List and return it
42
43 li # Showing the List after removing the last elements i.e [123, 234, 345,
44
45 li.pop(1) # Remove an element at a particular index
46
47 li # Showing the List after removing 1 index element i.e 234 op = [123,345
48
49 li2 = [234,456,789]
50
51 li.extend(li2)# Merge List 2 into List 1 i.e li2 elements added to li
52
53 li # o/p --> [123, 345, 654, 234, 456, 789]
54
